Intrusion of anterior teeth

Proclination of incisors

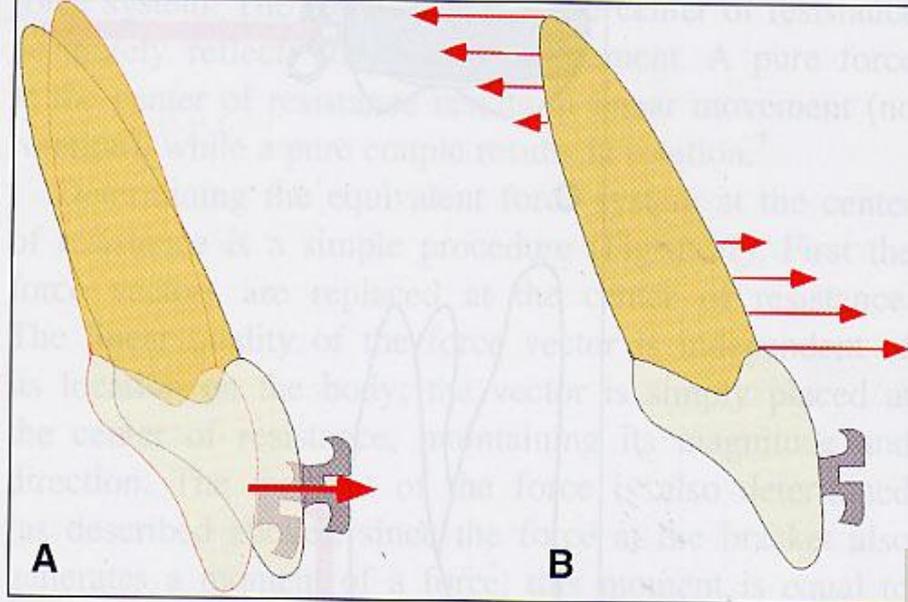

Fig. 1-12 Uncontrolled tipping. **A** Uncontrolled tipping produced by a single force (no applied moment). **B** Stress pattern in the periodontal ligament. Notice the root apex moves in the opposite direction from the movement of the crown.

Nekontroliran tipping

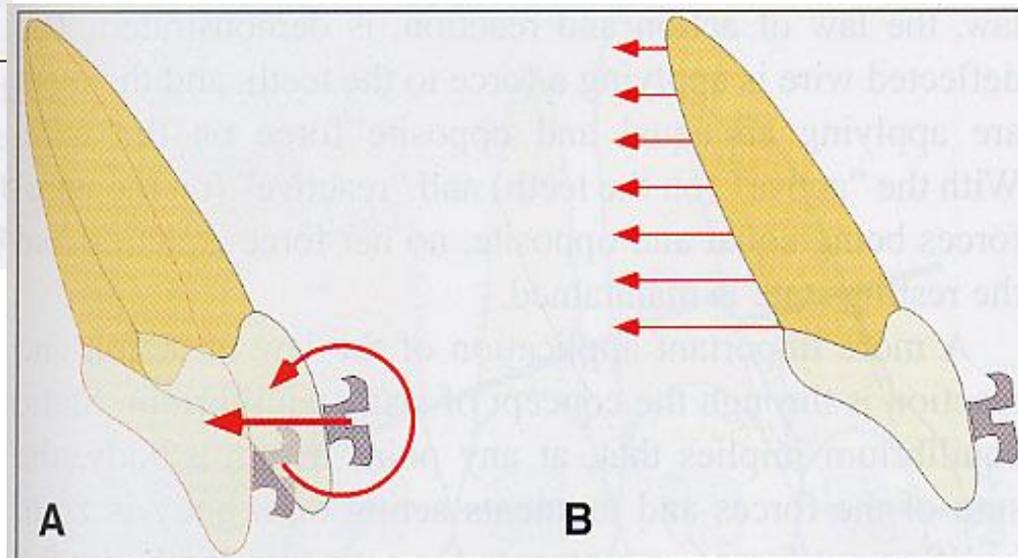

Fig. 1-13 Controlled tipping. **A** Controlled tipping with the center of rotation at the root apex. **B** Stress pattern in the periodontal ligament with controlled tipping. The stresses are greatest at the cervical margin.

Kontroliran tipping

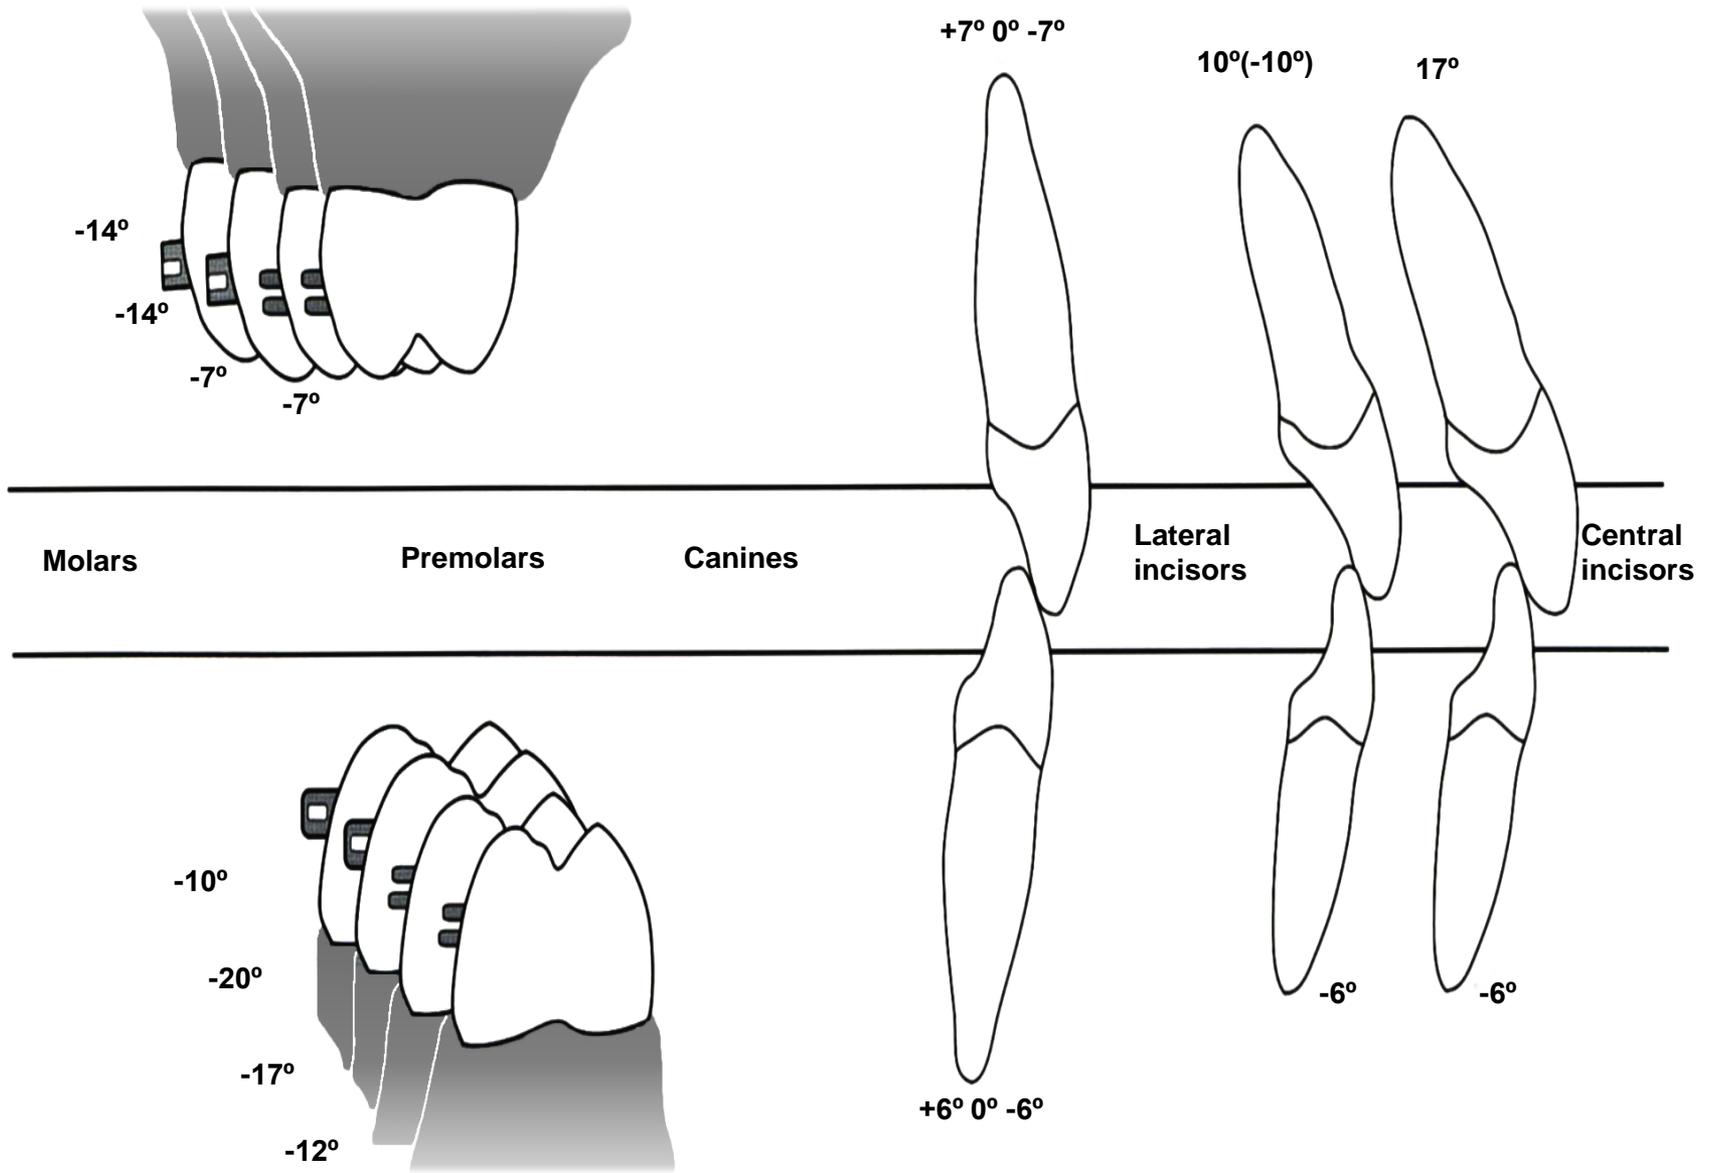

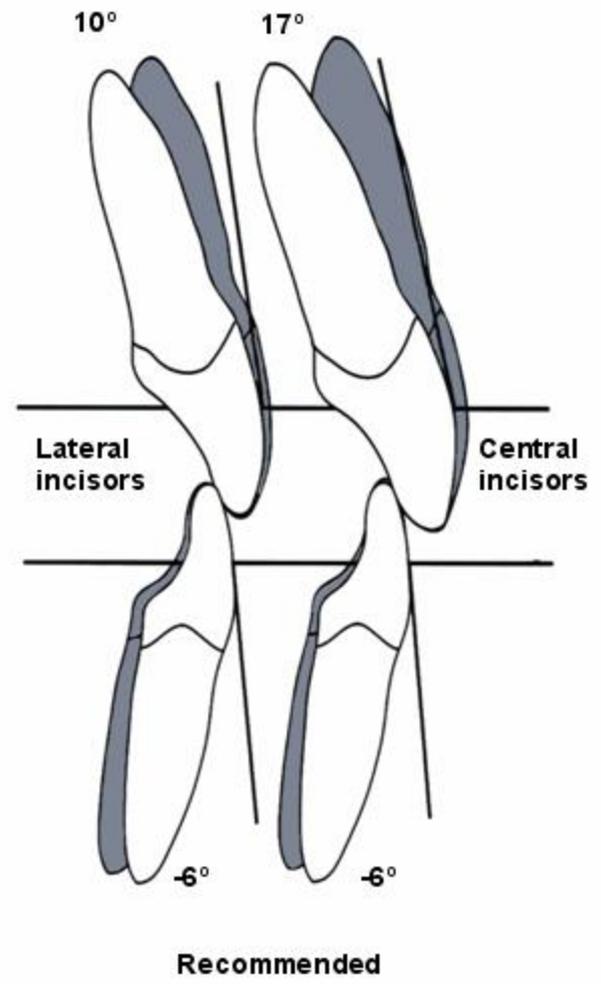

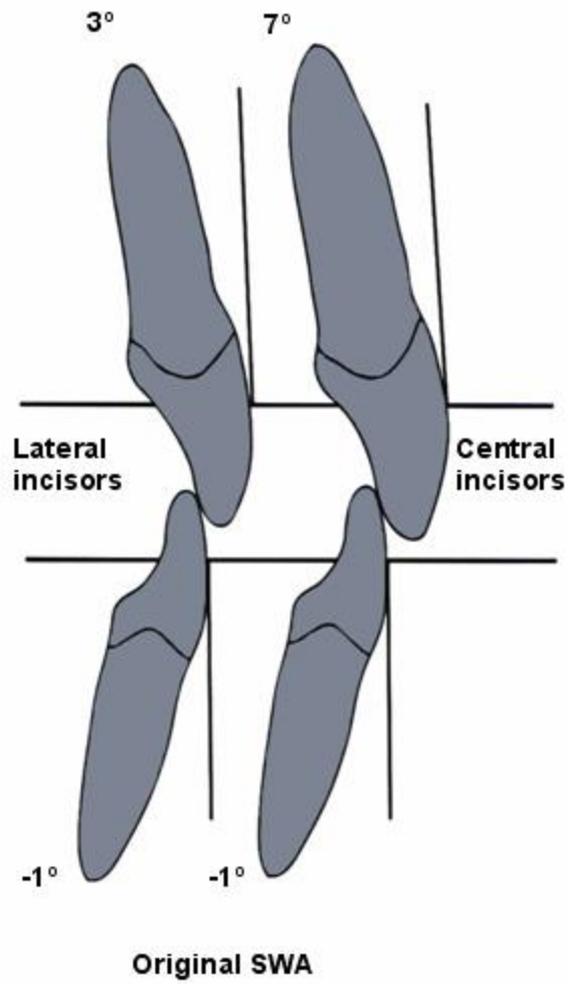

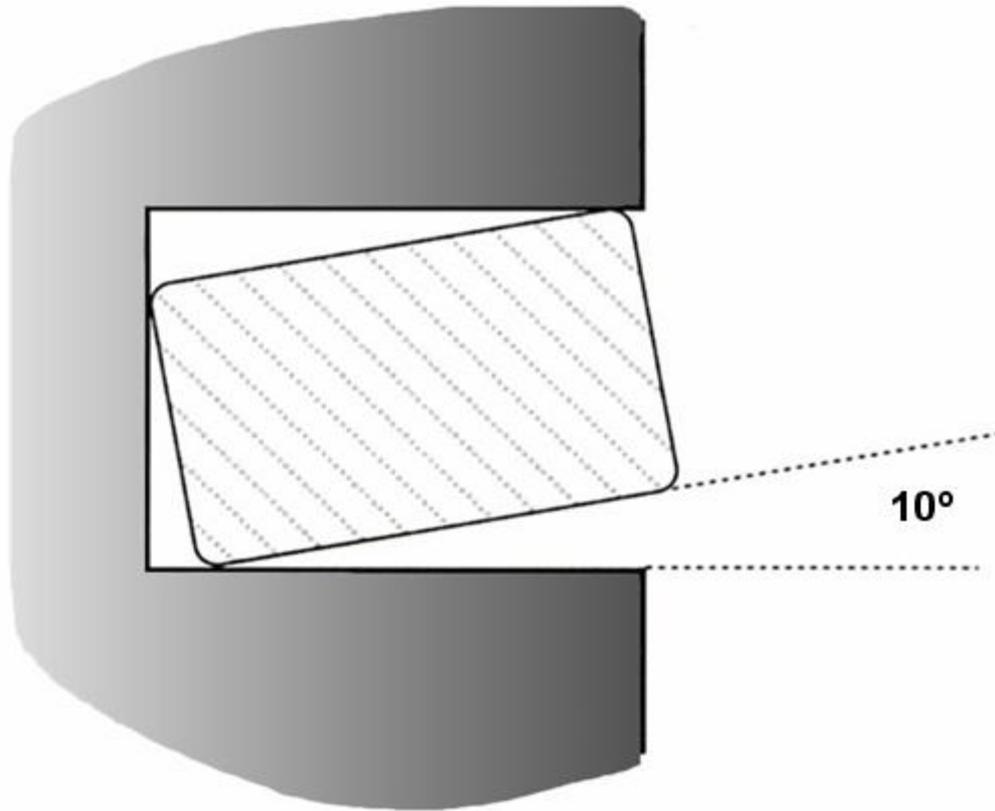

IZBIRA ORTODONTSKEGA APARATA

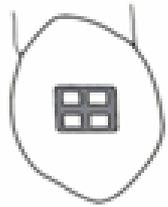

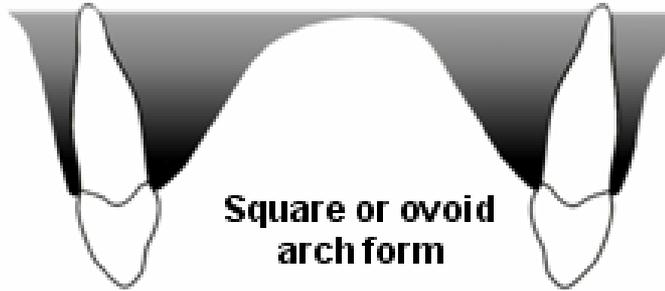

A rectangular .019/.025 steel wire in .022 slot will have approximately 10° of 'slop'. The exact amount depends on the precision of manufacture of the wire and bracket slot and the amount of wire edge 'rounding' or 'radiusing

Upper

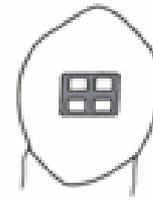

-7° torque

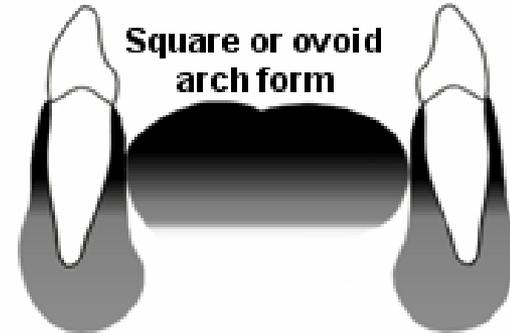

Square or ovoid arch form

Lower

-6° torque

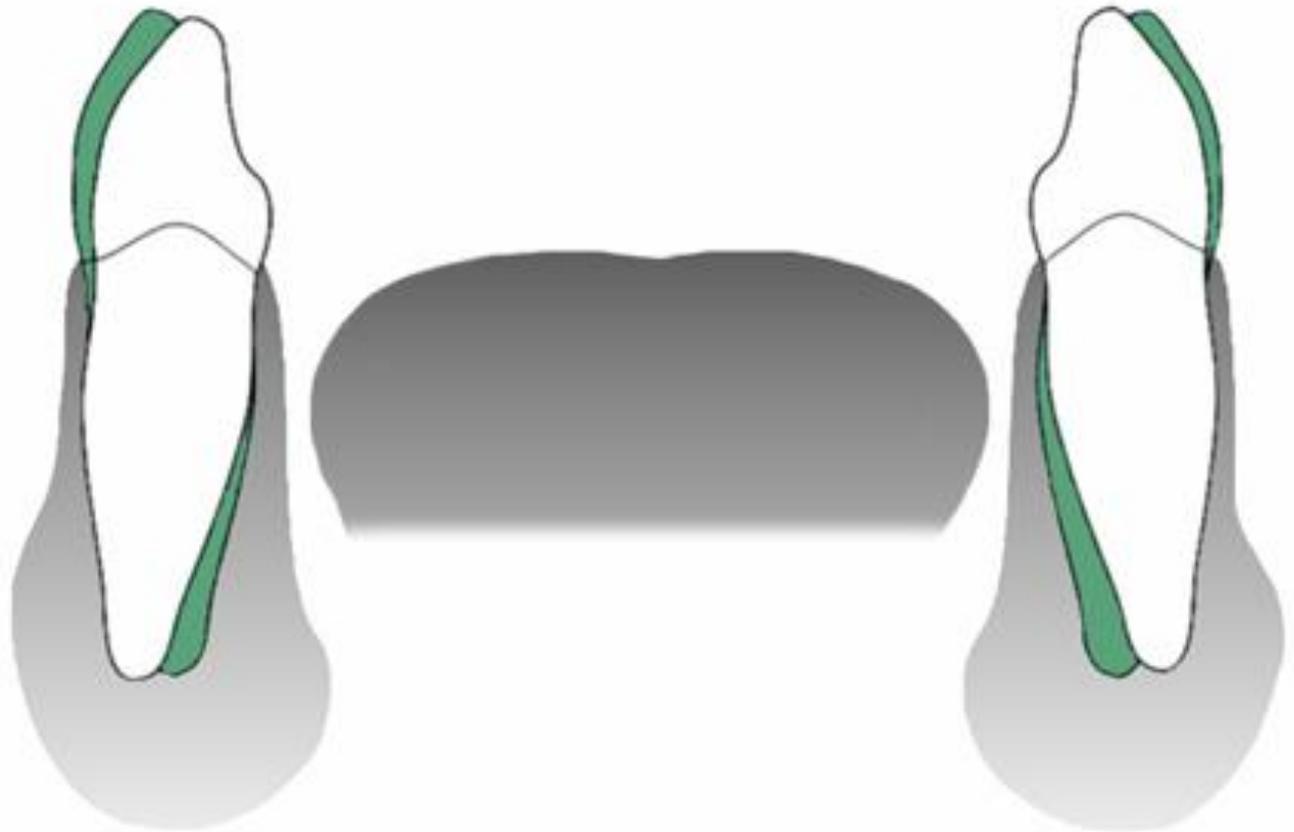

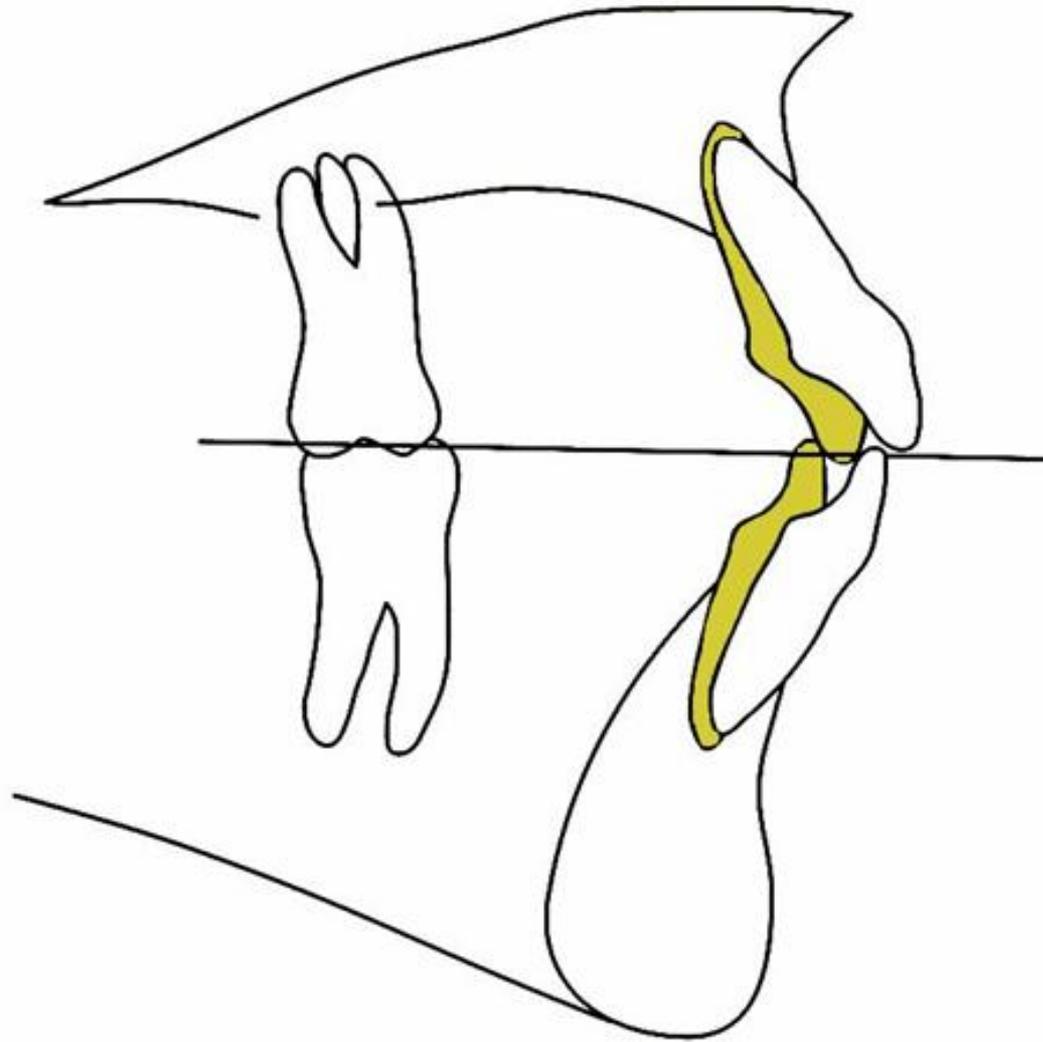

Square or ovoid arch form

Arch form is an important factor in selection of canine brackets in upper and lower arches.

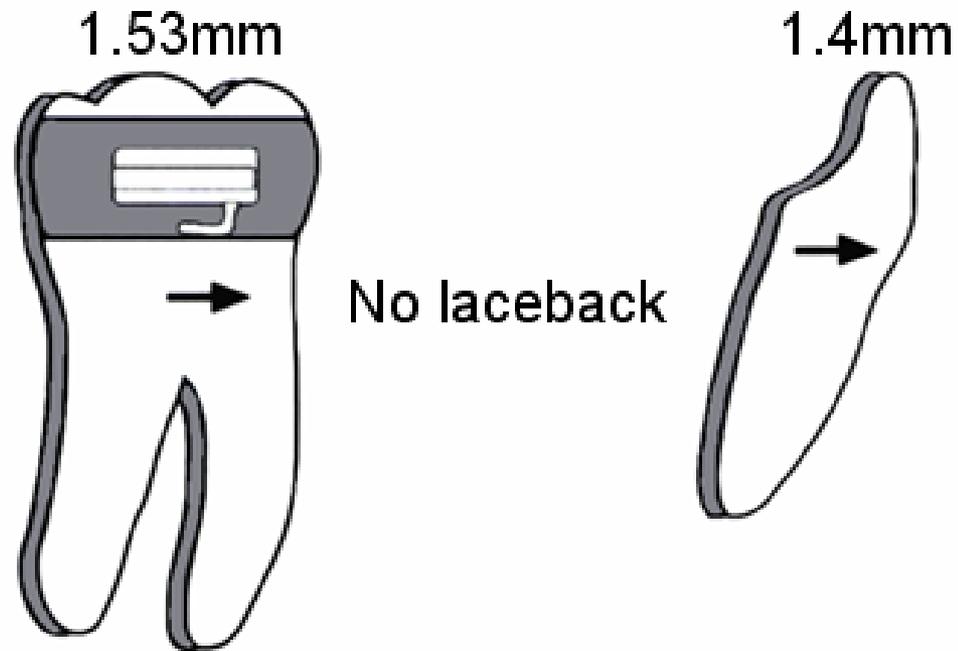

0° torque or
+6° torque

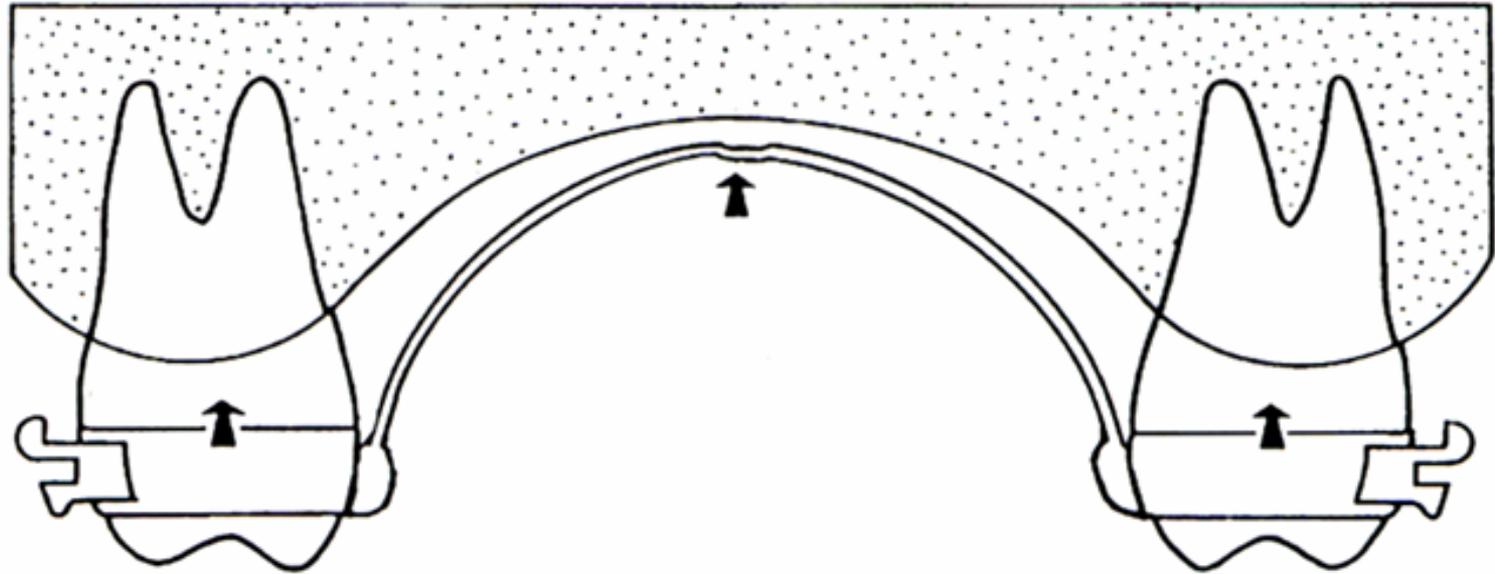

Bimaxillary protrusion

Without lacebacks, on average the lower incisor moved forwards 1.4 mm.

If the upper palatal bar is placed 2 mm away from the palate, tongue forces can assist in vertical control of the molars.

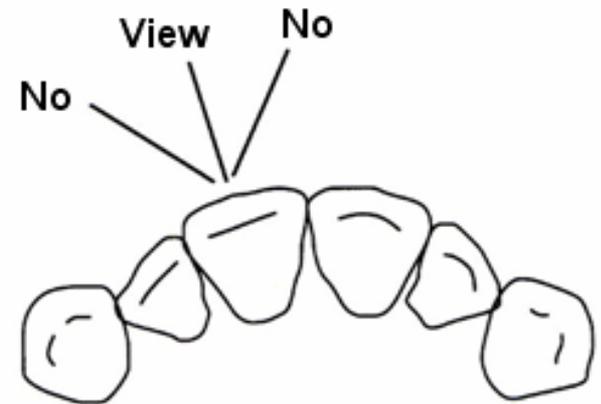

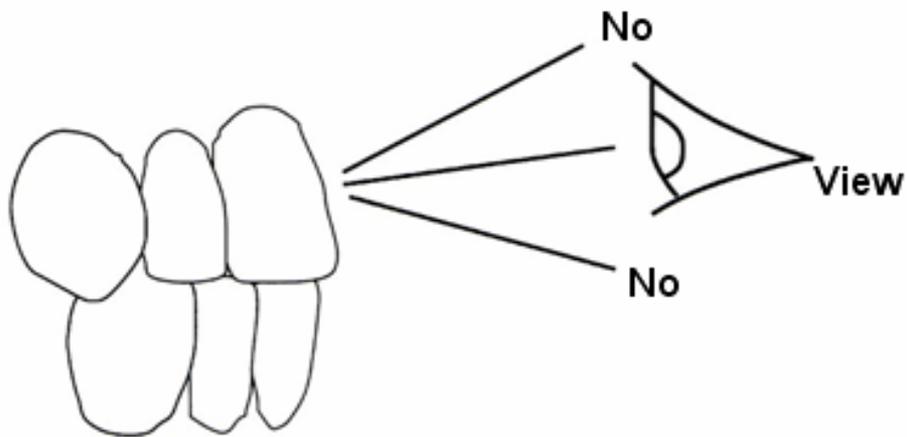

NAMEŠČANJE NOSILCEV

- NAJPOGOSTEJŠE NAPAKE PRI NAMEŠČANJU NOSILCEV
- REŠITVE, KI JIH PONUJA SISTEM MBT PRI NAMEŠČANJU NOSILCEV

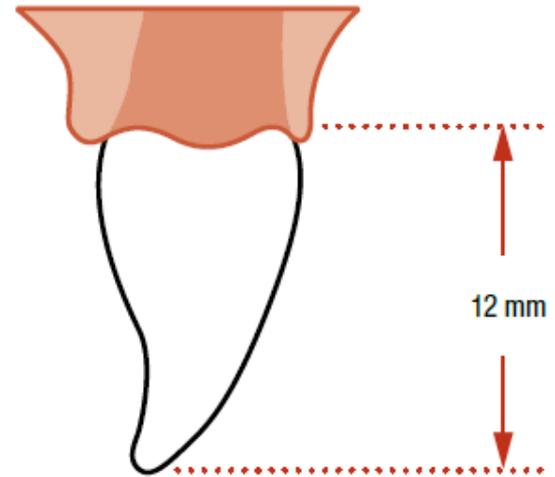

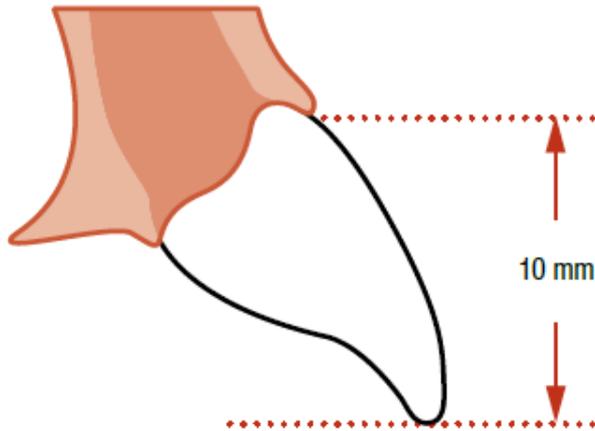

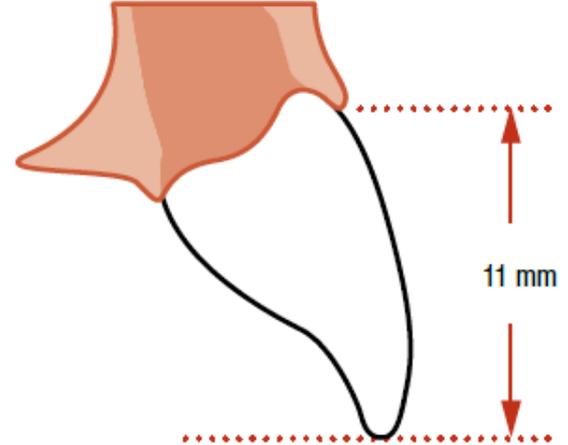

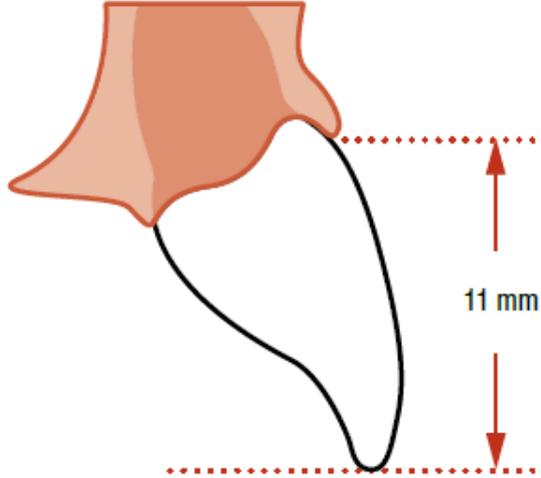

NAJPOGOSTEJŠE NAPAKE PRI NAMEŠČANJU NOSILCEV

When placing brackets, it is important to view the teeth from the correct perspective.

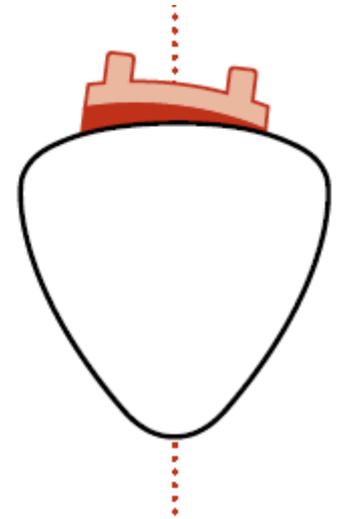

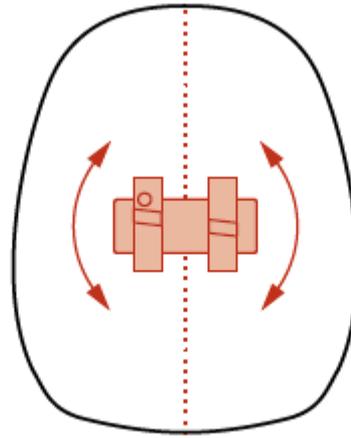

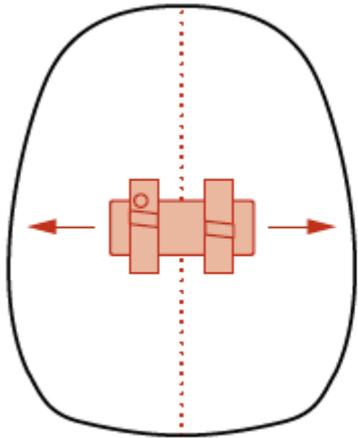

Teeth with roots that are lingually displaced can reveal shorter clinical crowns.

Teeth with roots that are facially displaced can reveal longer clinical crowns

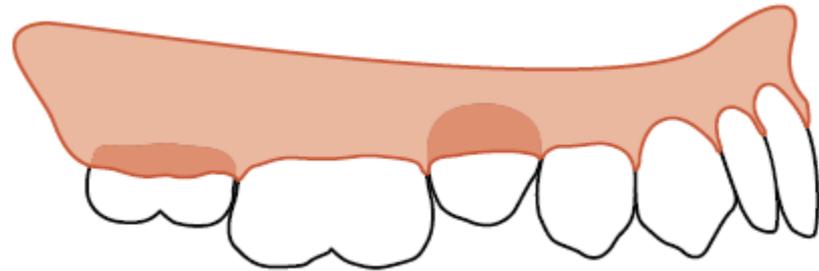

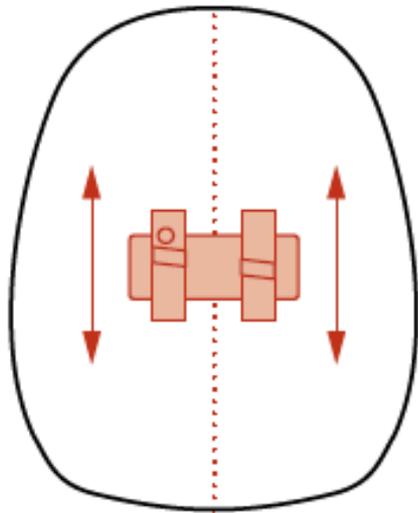

Horizontal bracket placement errors can result in unwanted rotation, but are avoided with attention to technique

Axial bracket placement errors can result in unwanted tip, but are avoided with attention to technique

Excessive adhesive under the bracket base can result in rotation errors, but are avoided with attention to technique. Figure 1 Figure 2 Figure 3 3 Bracket Placement

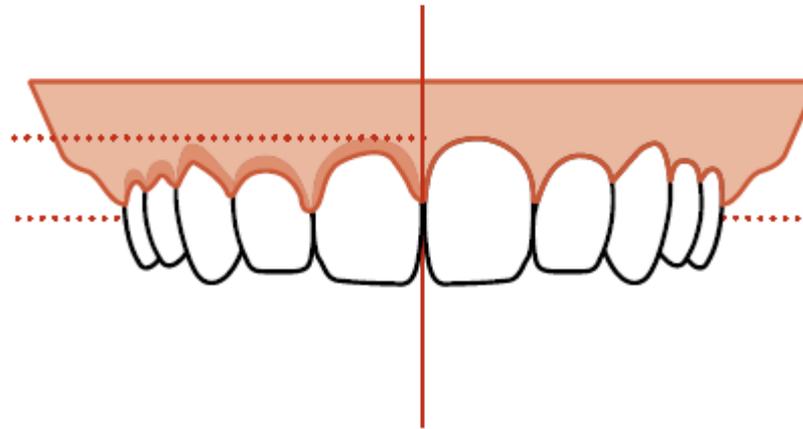

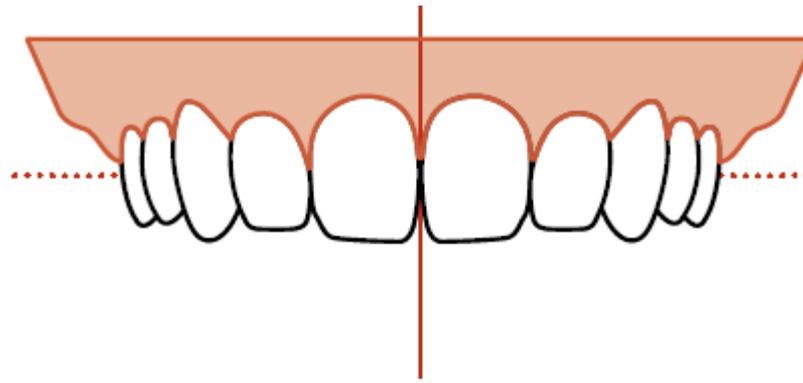

vertical errors

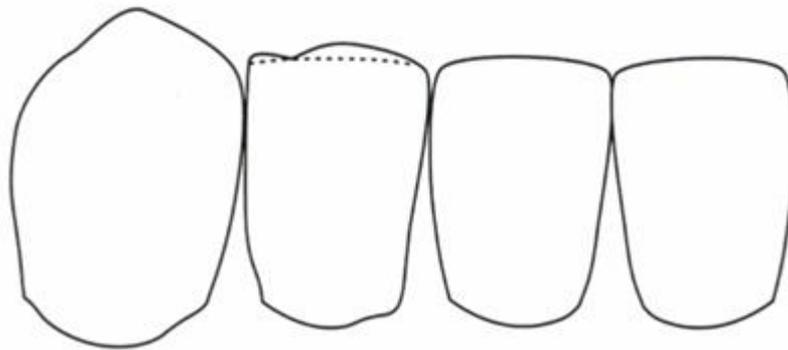

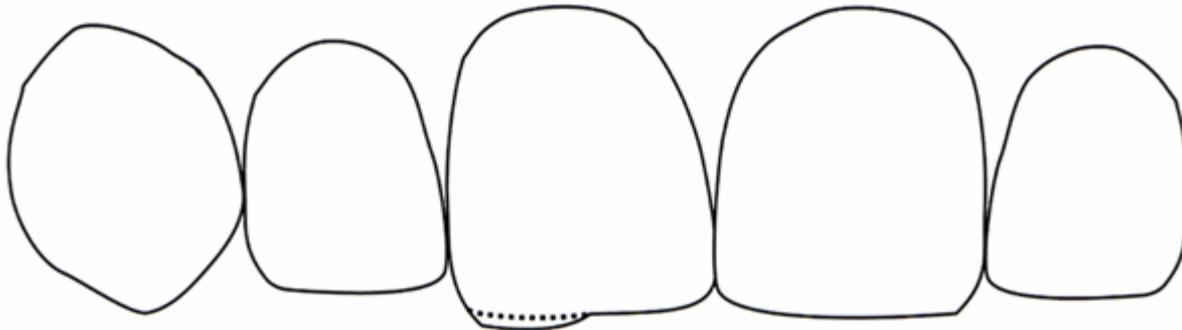

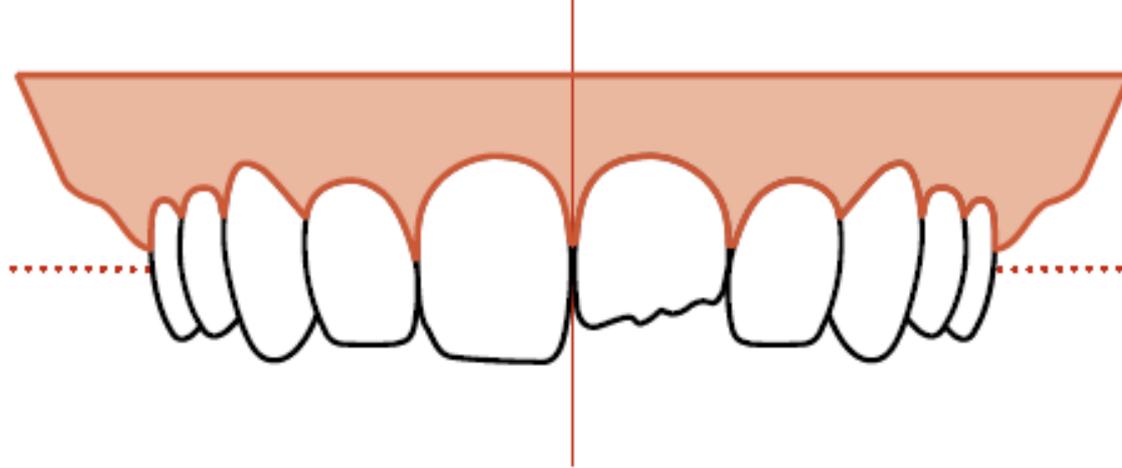

The center of the clinical crown is more difficult to visualize in partially erupted teeth in young patients

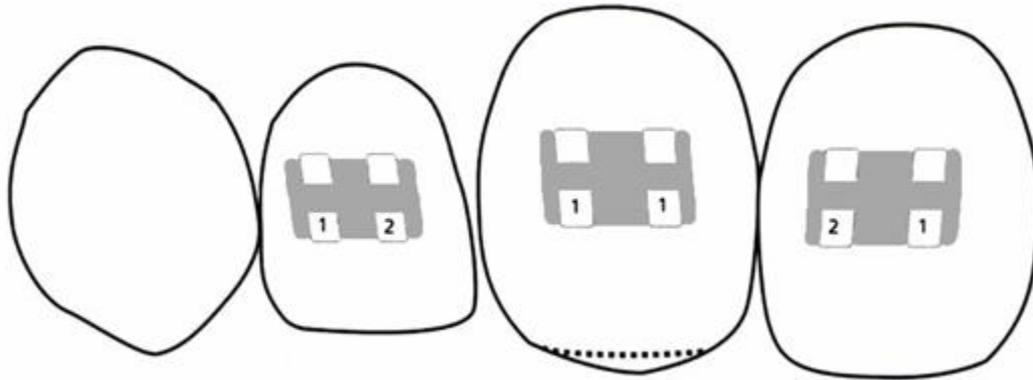

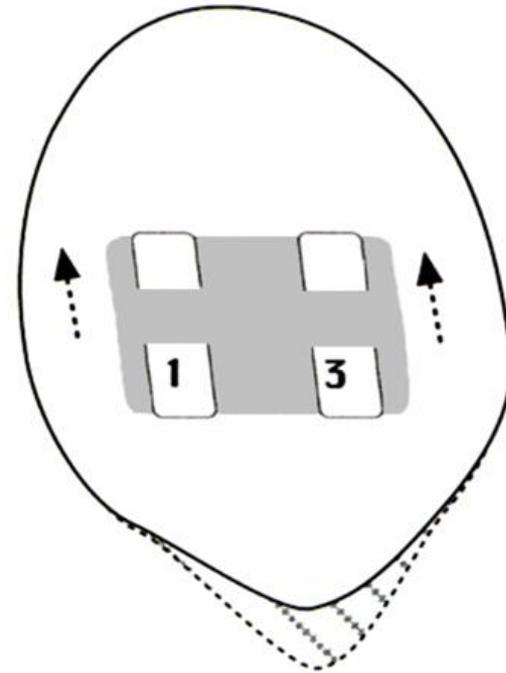

Inflamed gingival causes foreshortening, which can effectively reduce the length of the clinical crowns, making the center difficult to ascertain. The bottom image is the same case as the top image, but with gingival inflammation in the upper right quadrant

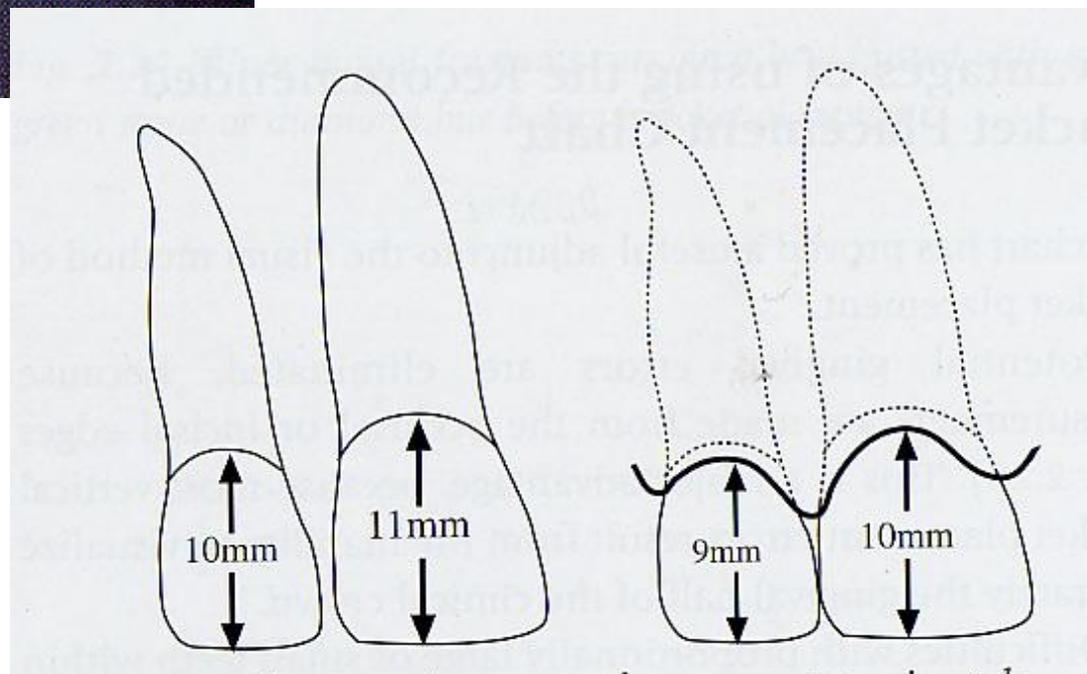

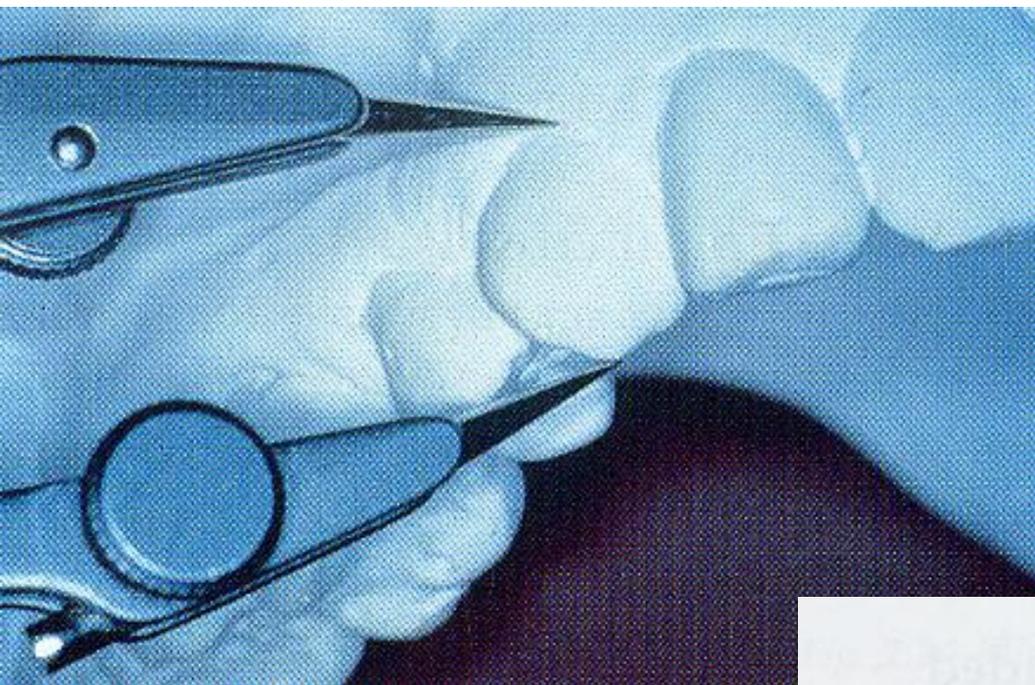

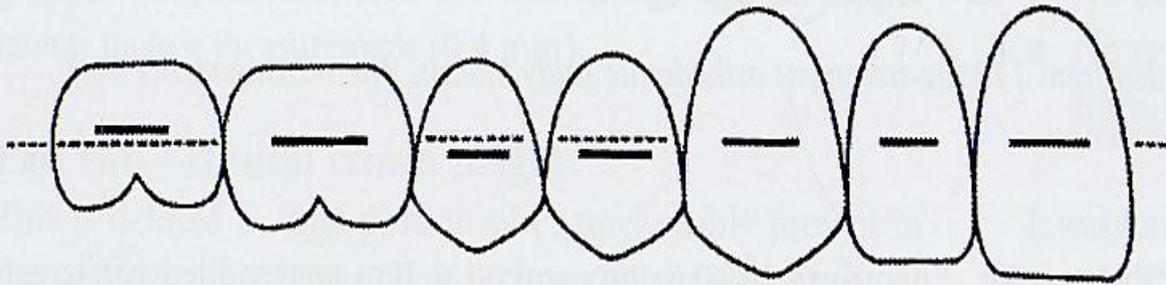

Correct vertical bracket positioning will minimize the need for detailing bends at the end of treatment.

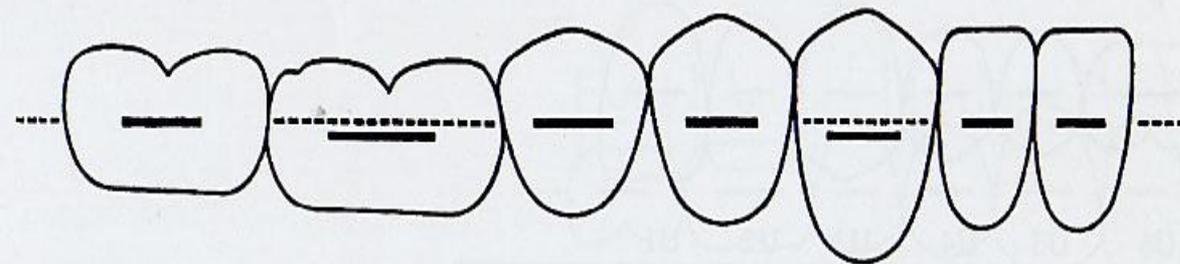

REŠITVE, KI JIH PONUJA SISTEM MBT PRI NAMEŠČANJU NOSILCEV

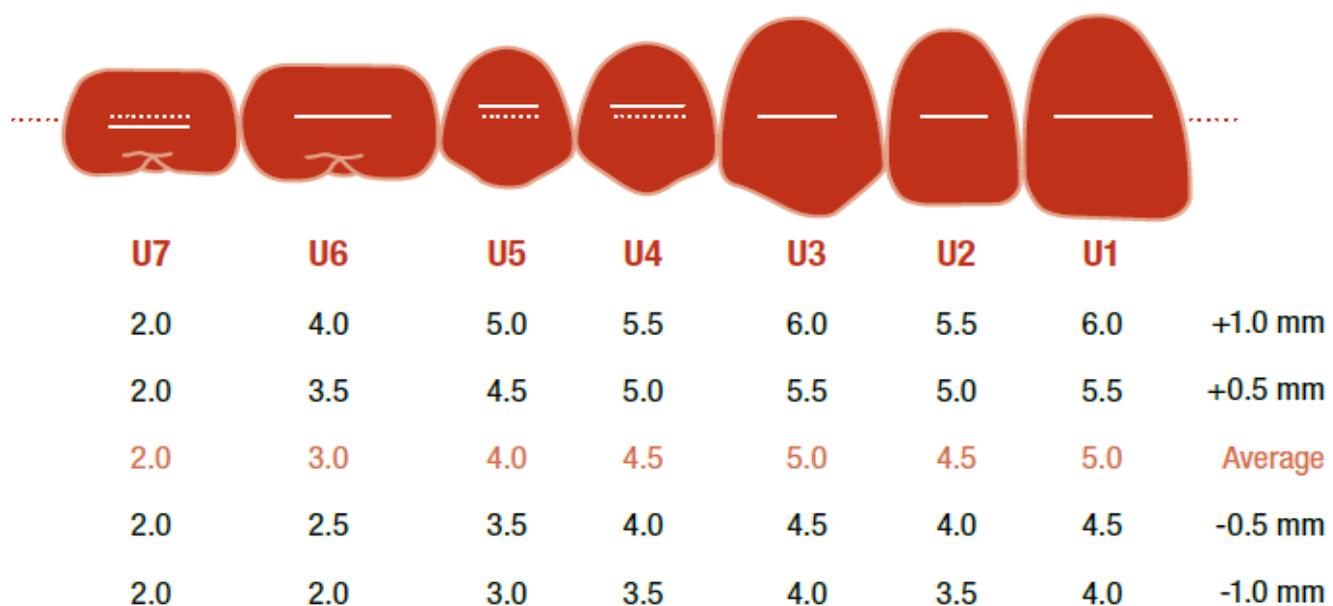

In the upper arch a straight line did not pass through the measured midpoints on the bicuspids and second molars, in most cases. Bicuspids were usually 0.5 mm more occlusal and second molars 0.5 mm to 1.0 mm more gingival.

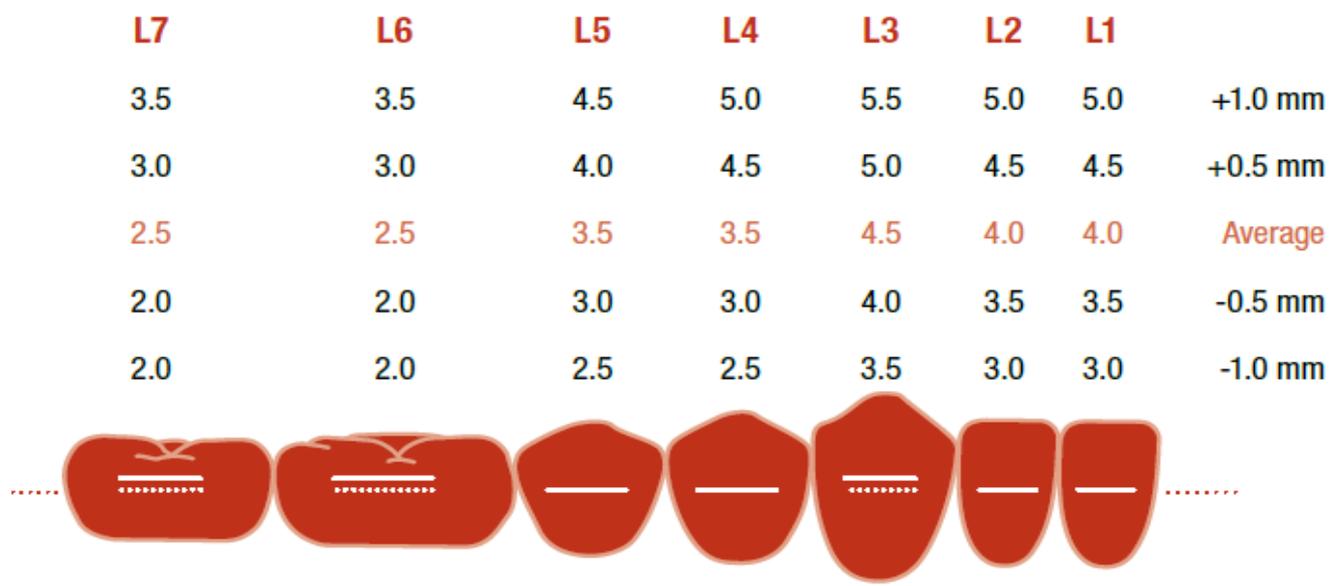

In the lower arch a straight line did not pass through the measured midpoints on lower cuspids and lower first molars. These midpoints were usually 0.5 mm gingival to the line.

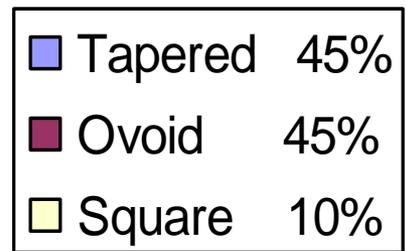

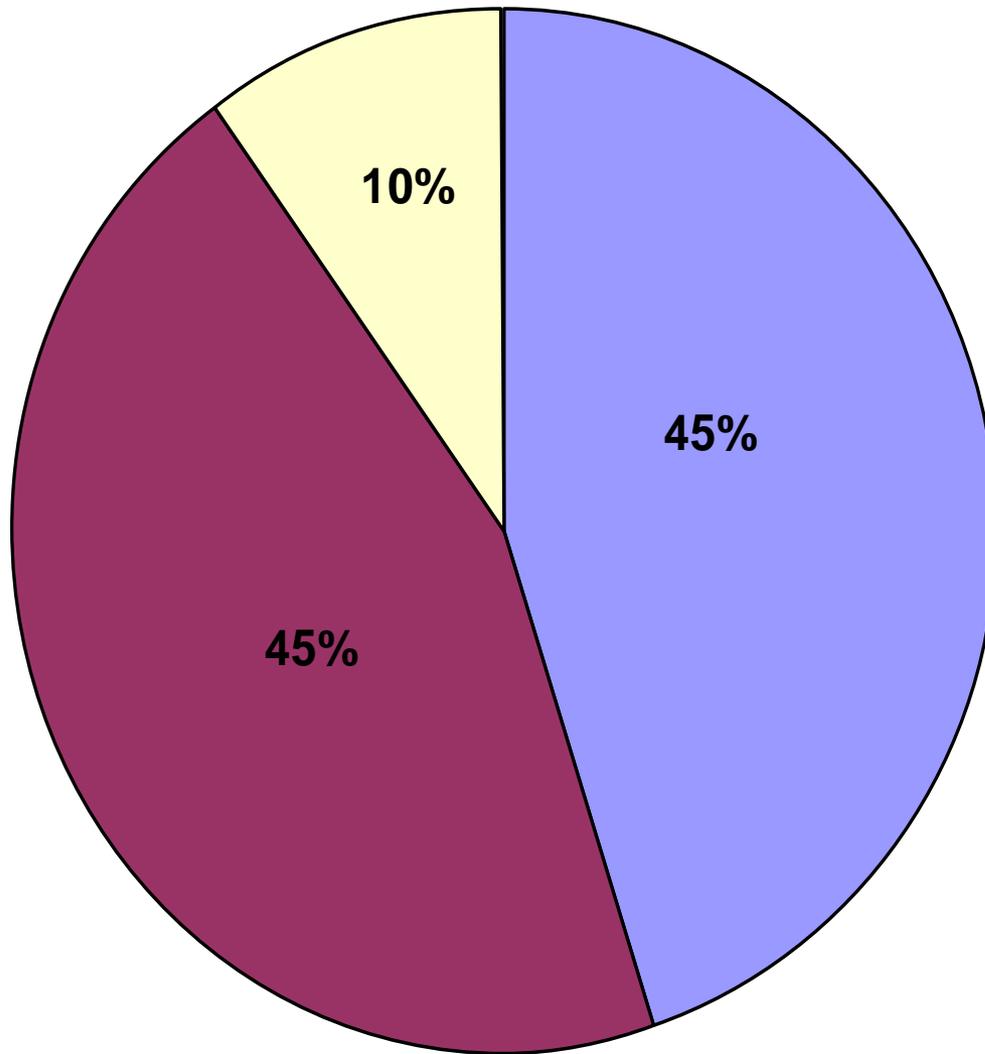

Bracket Placement Chart

Recommended ratios

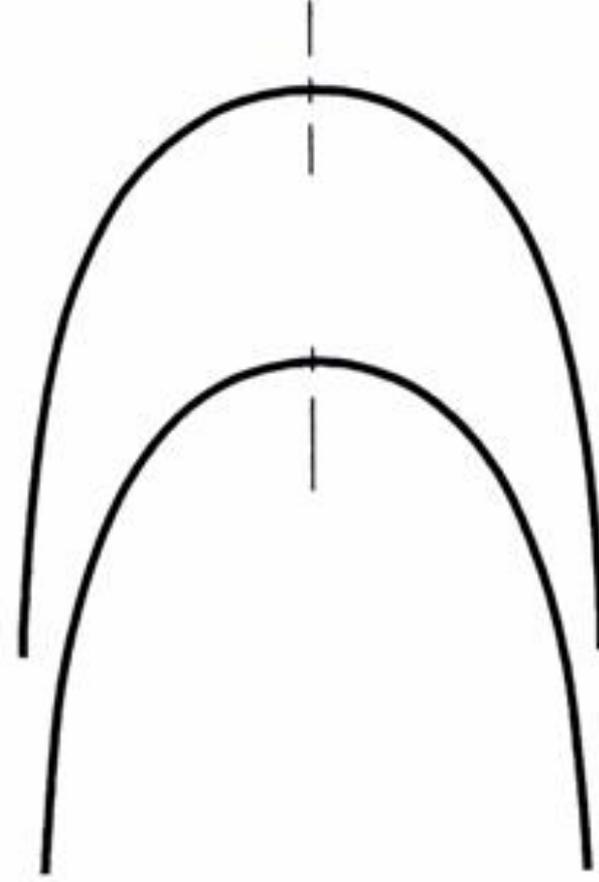

Tapered

Square

Ovoid

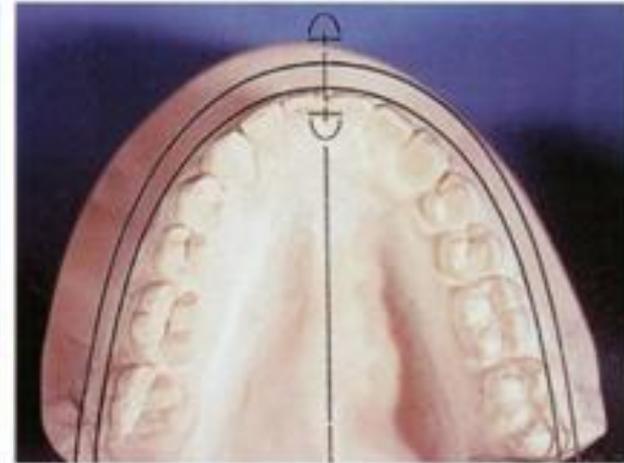

TAPERED

SQUARE

OVOID

Clear templates may be used at the start of treatment to assess whether the patient's lower arch has a tapered, square or ovoid form.

**.015 multistrand
.0175 multistrand
.014 round stainless steel
.016 round stainless steel
.018 round stainless steel
.020 round stainless steel
.016 HANT**

**Stocked in ovoid shape only
and modified to templates
as necessary**

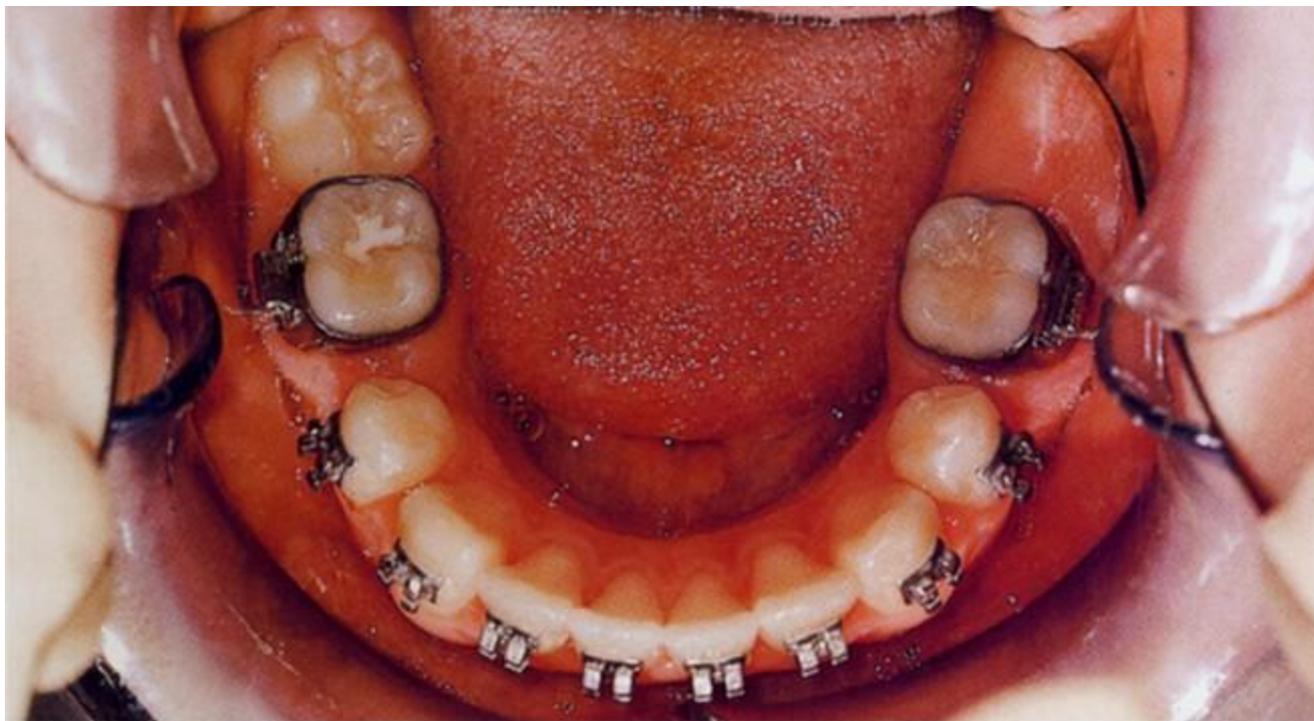

.019/.025 HANT

Stocked in three shapes:
– 45% tapered
– 10% square
– 45% ovoid

**.019/.025 stainless steel
with soldered hooks**

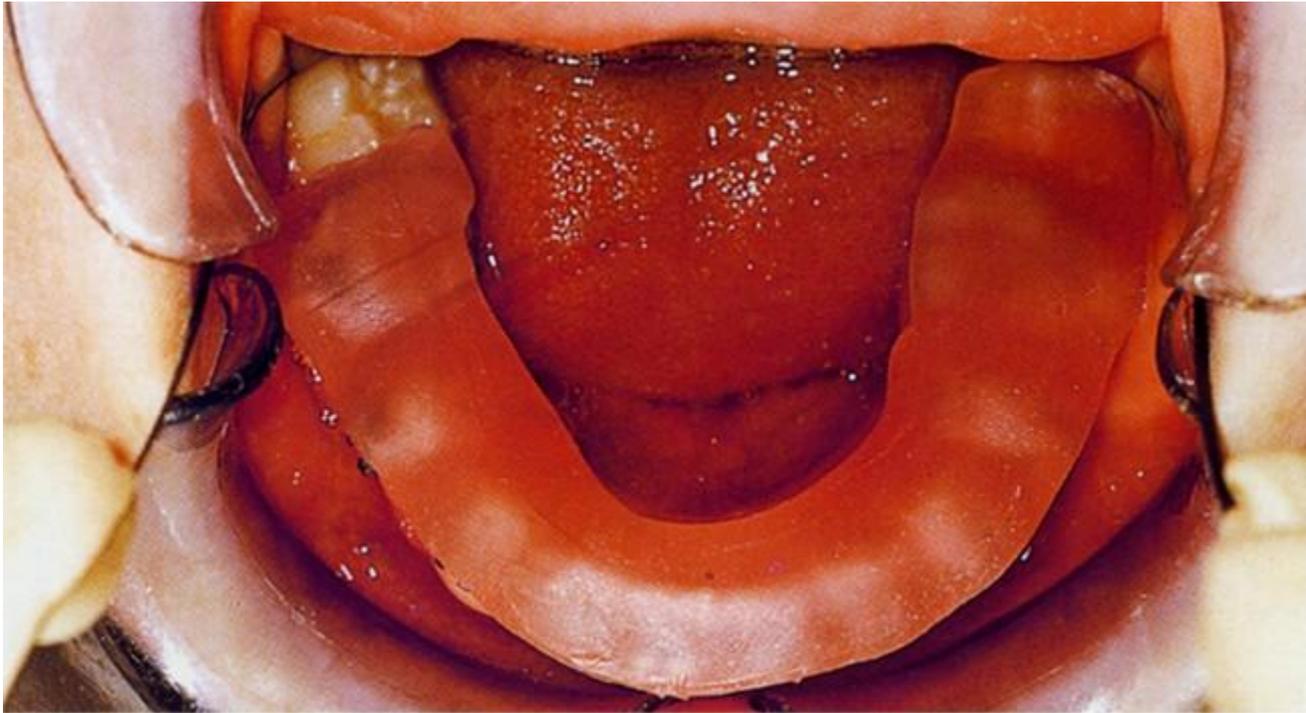

**Stocked in ovoid only, or in
three shapes (ovoid,
tapered and square) and
modified to the patient's
IAF from the wax template**

The lower rectangular HANT wire has been removed.

A wax template is softened in warm water and molded over the lower arch to record indentations of the brackets

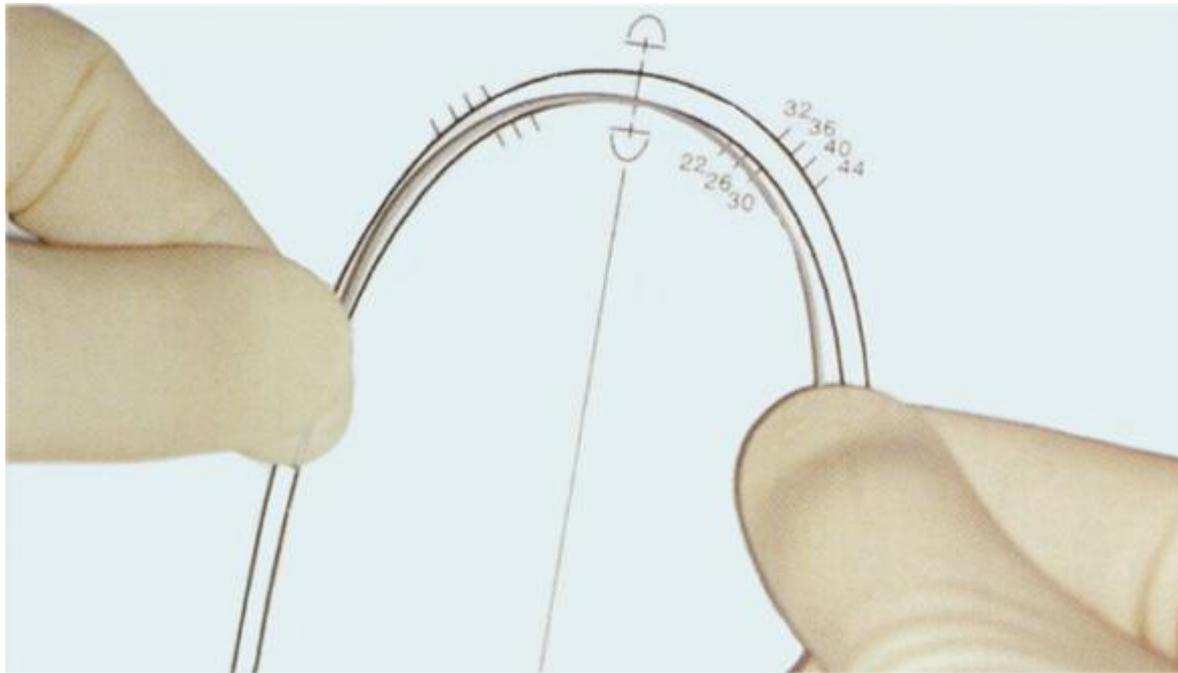

The wax template viewed from the labial.

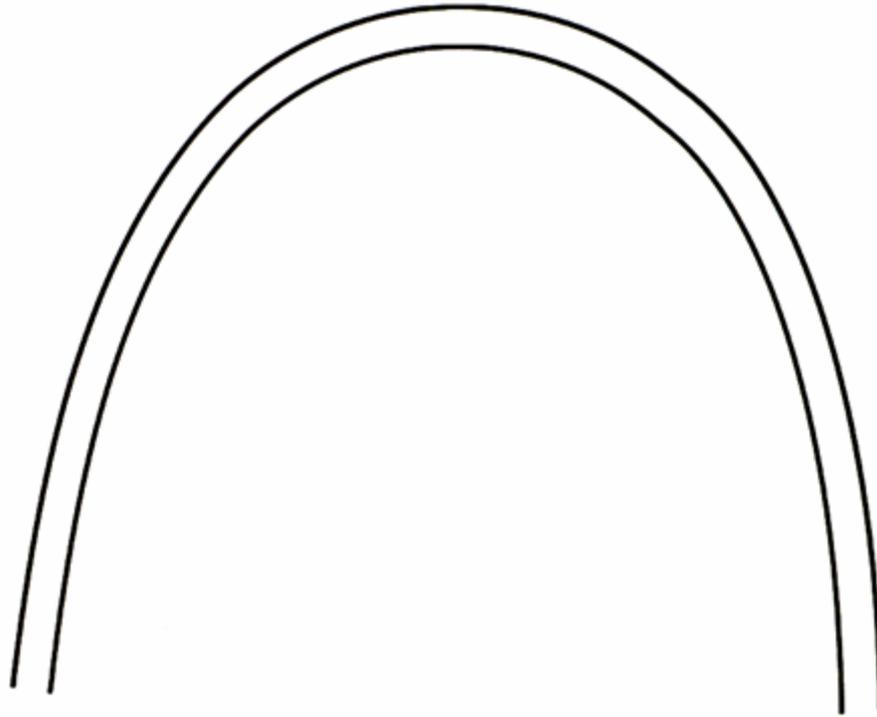

The .019/.025 rectangular steel wire is bent to the indentations

The steel rectangular wire is checked for symmetry on a template, and then a Xerox copy can be made and used as the patient's IAF for the lower arch.

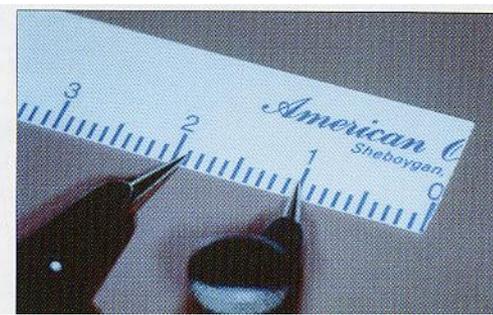

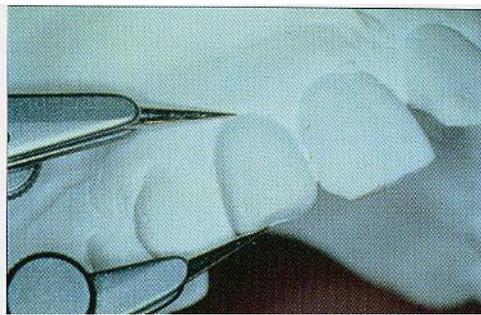

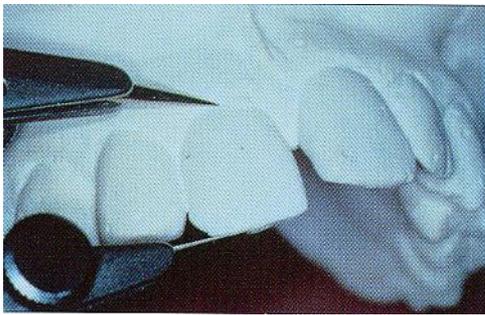

After the patient's IAF has been determined for the lower archwire, an upper wire can be created which should superimpose approximately 3 mm outside of the lower wire.

Licensed to Beli Medved D.O.O.

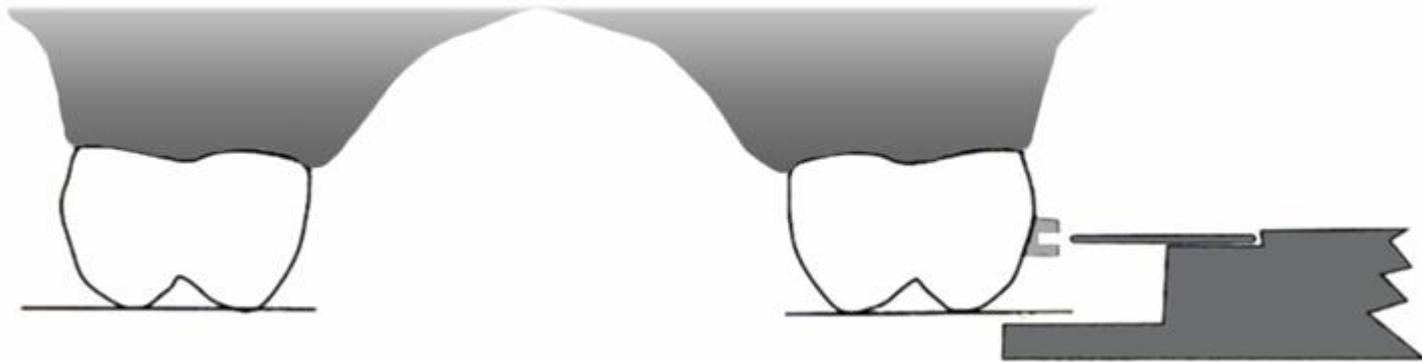

In the incisor region, the gauge is placed at 90° to the labial surface.

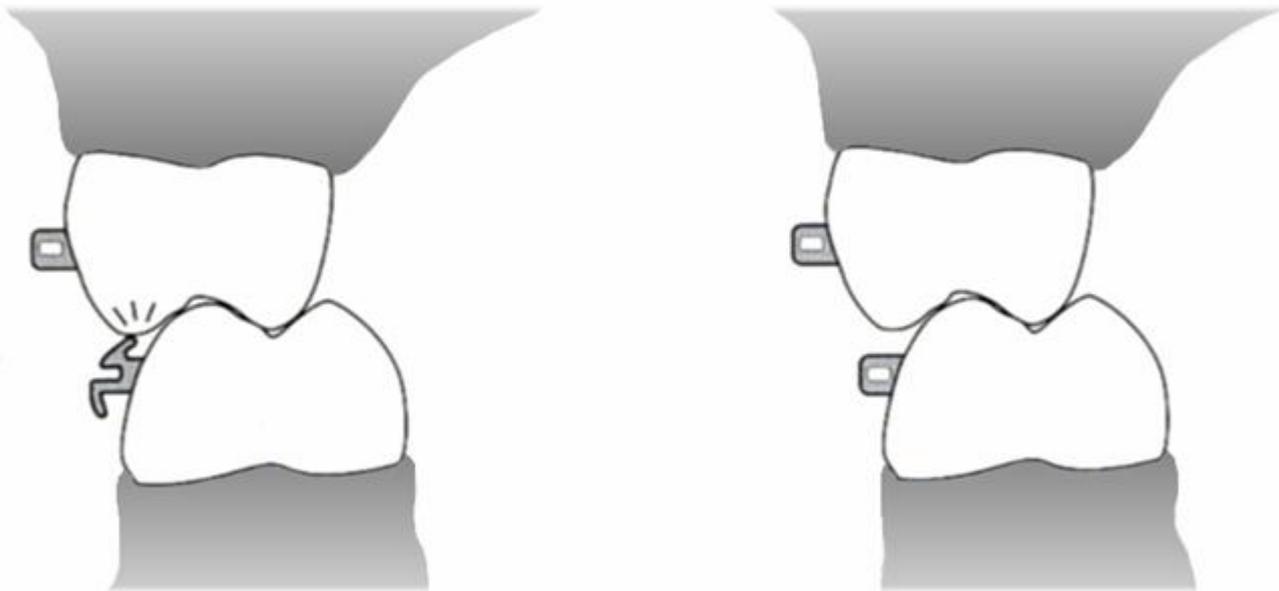

In the canine and premolar regions, the gauge is placed parallel with the occlusal plane.

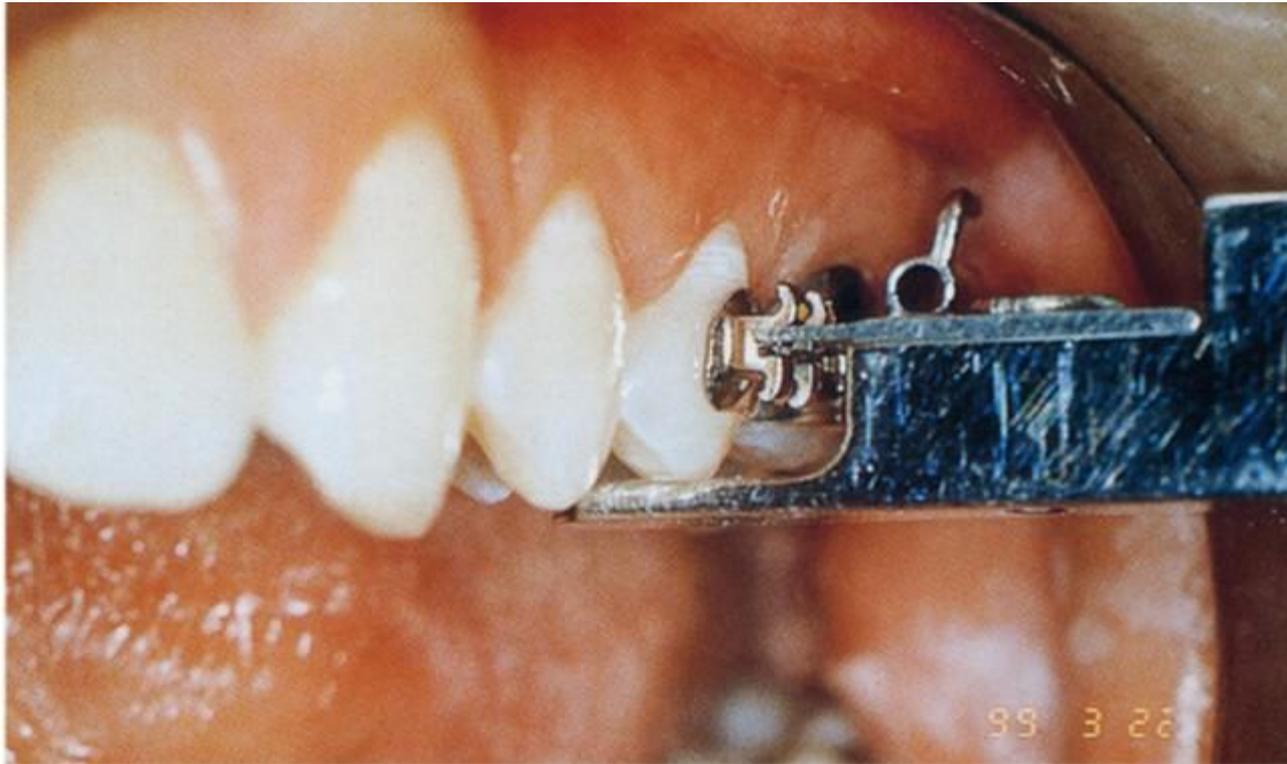

In the molar regions, the gauge is placed parallel with the occlusal surface of each individual molar.

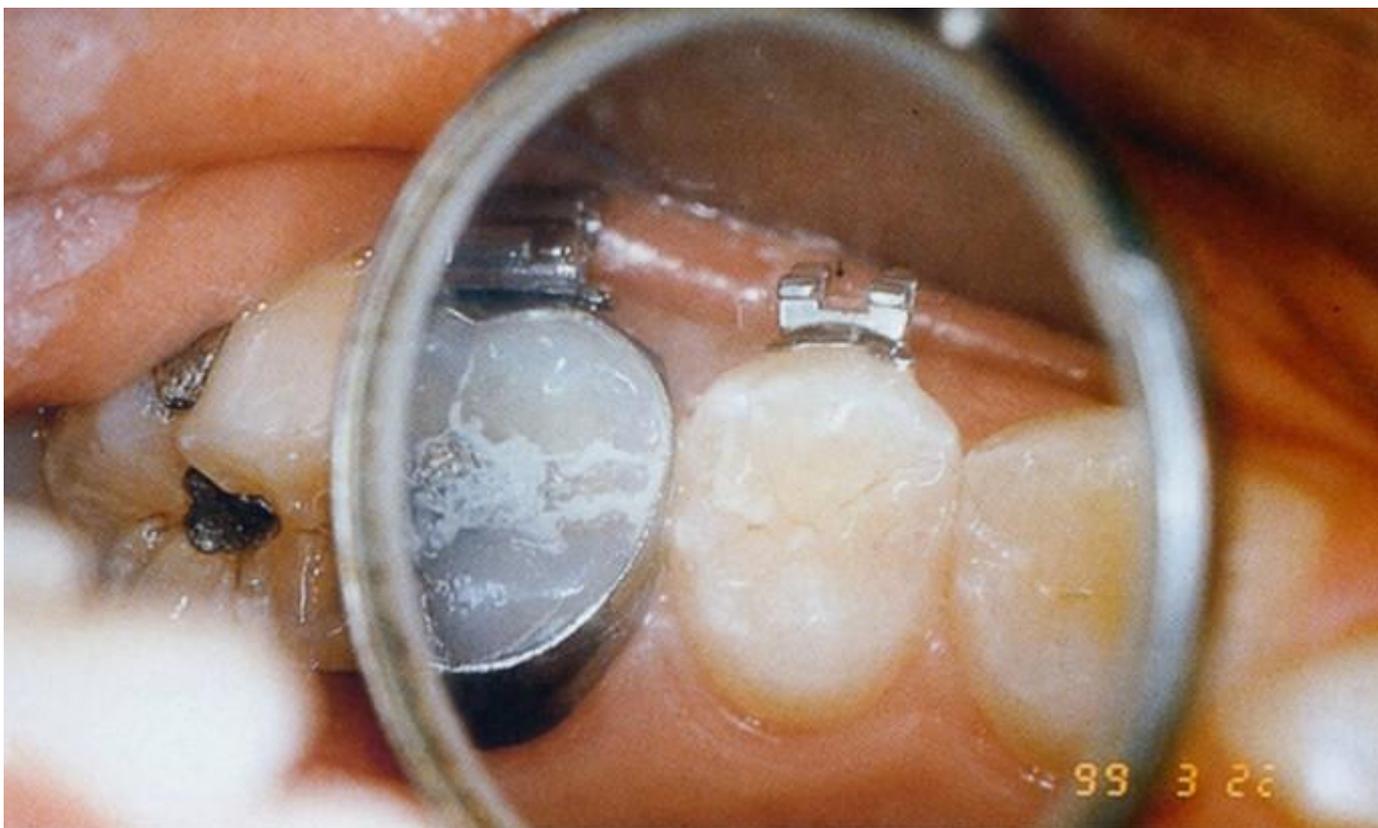

Lower first molar non-convertible tubes are often preferable to convertible tubes, because they are less bulky. They are stronger, more comfortable, and cause fewer interferences.

Horizontal and vertical accuracy can be checked from the buccal aspect

Horizontal accuracy in the canine, premolar, and molar regions should be checked with a mouth mirror.

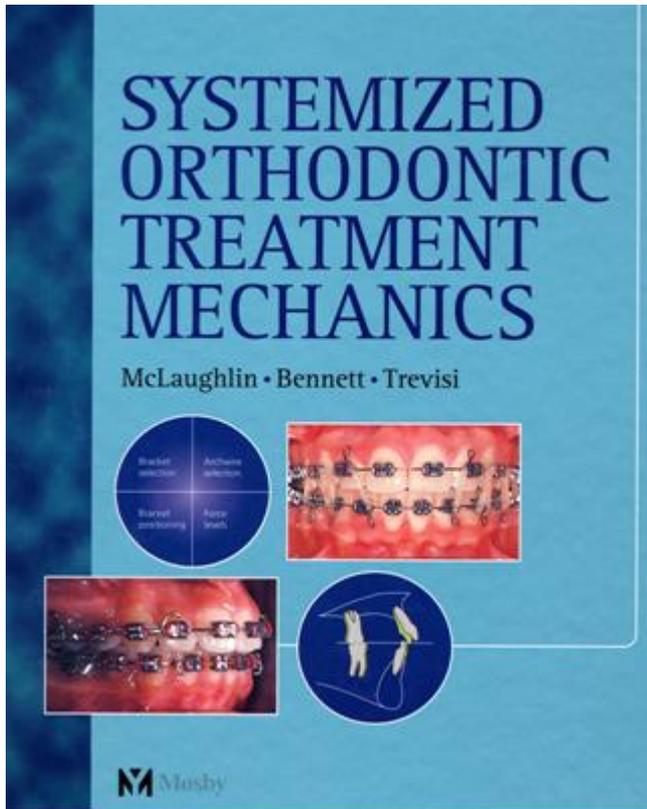

Povzetek predavanja

- Natančna ortodontska diagnostika
- Določitev točnega cilja ortodontske terapije
- Izbira pravega sistema za ortodontsko zdravljenje
- Individualizaciji sistema
- Natančnost pri namestitvi nosilcev
